### Description

TheGreenBow builds security software products, stand alone or packaged in Security Suite, to secure enterprise communications and data on the desktop. Our security softwares are designed to be integrated with already deployed security solutions like a Bio Token, PKI, VPN appliance or Antivirus. They are also designed to be centrally managed to build coherent enterprise security and reduce TCO.

#### Secure emails and files

CryptoMailer™ is the fastest and most easy to use Encryption Tool you can get. It is immediately operational and does not require any complex configuration or time-consuming key management.

#### Email encryption

Becoming a key component to enterprise security, email encryption allows confidential data to be sent via email. Your confidential data can be financial books that you receive from your accounting firm or feed back on a strategic project you send to your lawyer firm.

#### One click file Encryption

File encryption must be simple and easy. You just need to select the files and right click to "Encrypt" menu option to secure all your confidential data. You will be asked for your password.

#### Strong Encryption

TheGreenBow email encryption software is based on strong encryption algorithm (3DES or AES with 128bit key) and protected by an optional user password. Email encryption from TheGreenbow works with all email software (Outlook, Thunderbird, Eudora, ...).

Prezzo per singola licenza.
